SKILLS

Programming Languages:	Python, TypeScript, JavaScript, Java, SQL, Ruby, C++
AI & LLMs:	Amazon Bedrock, Jev (TypeSafe), Kimi K3, MCP, agent harnesses, LLM judges
Frameworks & Tools:	React, Node.js, Electron, pandas, Jupyter, Stripe, GitHub Actions, Databricks
AWS:	CDK, Lambda, API Gateway, Step Functions, DynamoDB, S3, CloudWatch

EXPERIENCE

AWS

Chicago, IL

Software Development Engineer 2

August 2022 - Present

- Designed weighted cross-account Bedrock routing with refreshable assume-role sessions for 5 LLM-backed services, adding TPM/RPM headroom, and built failure logging and per-call telemetry for every invocation
- Led security remediation and productionization of an internal AI content platform (~1,400 users), moving a desktop-deployed prototype to CDK pipelines and resolving Sev-2 security review findings
- Authored the team's security and development standards: explicit API Gateway routes with OpenAPI specs before build, two-person review for admin access changes, and per-pod AppSec ownership
- Hardened production services with strict CSP across 10+ web packages and PII masking in CloudWatch Logs, and fixed script injection, path traversal, and XML parser DoS vulnerabilities
- Built the simulation phase of an agentic strategy platform end to end, including a human-in-the-loop gate with stale task-token recovery, an agent-loop interrupt for caller-executed tools, and artifact provenance
- Delivered a customer assignment feature across UI, Lambda ingestion, schema, bulk upload, and Salesforce sync for AWS's org-mapping service; built a Neptune graph export and an on-call triage agent
- Built a React profile page embedded in Salesforce serving 60k monthly users and 1M monthly page events
- Shipped 181 code reviews across 59 packages in 12 months; mentored 2 engineers through promotion

Confusion

confusion.app

Founder & Creator

February 2026 - Present

- Built a cross-platform visual ETL desktop app (Electron, React, TypeScript) that compiles node graphs of 400+ operations into pandas code run on an embedded Jupyter kernel; shipped 50+ signed releases
- Integrated TypeSafe's Jev to draft pipelines from a plain-English plan, decomposing graph building into parallel Choice questions (one operation per step, one source per input) answered in a few windowed calls
- Fit 400+ operations within Jev's 255-option and token limits via two-stage narrowing that hedges across categories holding 90% of the probability mass; made cycles unrepresentable by offering only earlier nodes
- Designed the serverless backend in AWS CDK (Cognito, HTTP and WebSocket API Gateway, 12 Lambdas, DynamoDB, S3) with a client-driven agent loop that proxies 41 tool definitions to Kimi K3
- Built per-user token metering shared by chat and Jev drafting, webhook-driven Stripe subscriptions, and an MCP server exposing 41 tools to external AI agents

EY

Chicago, IL

Tax, Technology, and Transformation Software Developer

July 2021 - July 2022

- Automated tax prep in Python, saving 50 to 60 hours per client and auto-preparing 65% of tax data
- Built an Azure onboarding pipeline cutting deployment time by 70%, enabling growth from 80 to 200 clients
- Optimized Databricks and SQL ETL feeding client and internal dashboards, cutting runtime by 50%
- Deployed Alteryx checks cutting response time from 2 weeks to 2 days for 60% of tax data errors

EDUCATION

Grainger College of Engineering at University of Illinois - Urbana-Champaign

BS in Mechanical Engineering / Minor in Computer Science GPA: 3.70

August 2017 - May 2021
